

SoftBee Smart Estimation ? sample project brief (manual test)

Project name: Weather Ping Bot

Client type: Personal utility / MVP

Goal: Build a Telegram bot that sends me the current weather for my city as PDF and TXT files on demand.

Problem

I check weather in multiple apps and want one bot command that delivers a short forecast I can save or forward.

Must-have features

1. Telegram bot with /start, /help, and /weather commands
2. User sets default city once (e.g. /setcity Kyiv)
3. /weather returns current conditions: temperature, humidity, wind, short summary
4. Same response delivered as both .txt and .pdf attachments
5. Basic error handling for unknown city / API downtime
6. Simple rate limit: max 20 weather requests per user per day

Nice-to-have

- /forecast for next 3 days
- Inline city search suggestions
- Optional scheduled morning weather push

Technical preferences

- Node.js + TypeScript (or Python FastAPI)
- Telegram Bot API
- Any public weather API (OpenWeatherMap or similar)
- PDF generation via a lightweight library
- Deploy on a single small VPS or Railway

Non-functional requirements

- Target build in 1?2 weeks
- Single-user first, then up to ~50 users
- Response under 5s for /weather
- Store only telegram user id + preferred city

Out of scope for v1

- Multi-language UI
- Maps / radar imagery
- Native mobile app
- Payment / subscriptions

Acceptance criteria for estimate

Please return a preliminary hours range and budget range for design + engineering, including QA and a short setup buffer. Call out risks (Telegram file limits, PDF generation, weather API quotas) if they affect the estimate.

Sample user story

As a user, I want to send /weather and receive TXT + PDF with today?s conditions for my saved city so I can quickly check and share the forecast.
